

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

5. Control System

A: GENERAL

The ECM receives signals from various sensors, switches, and other control modules. Using these signals, it determines the engine operating conditions and if necessary, emits signals to one or more systems to control them for optimum operation.

Major control items of the ECM are as follow:

- Fuel injection control
- Ignition control
- Idle air control
- Fuel pump control
- Canister purge control*¹
- Radiator fan control*²
- On-board diagnosis function

*1: Canister purge control is described under EC(H4SO) — Emission Control (Aux. Emission Control Devices) Evaporative Emission Control System.

*2: Radiator fan control is described under CO(H4SO) — COOLING.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

B: INPUT AND OUTPUT SIGNALS

Signal	Unit	Function
Input signals	Manifold absolute pressure sensor	Detects the intake air pipe (absolute) pressure.
	Intake air temperature sensor	Detects the intake air temperature.
	Atmospheric pressure sensor	Detects the amount of intake air (measures the atmospheric pressure).
	Throttle position sensor	Detects the throttle valve position.
	Front oxygen (A/F) sensor	Detects the density of oxygen in exhaust gases at the upstream of the front catalytic converter.
	Rear oxygen sensor	Detects the density of oxygen in exhaust gases at the downstream of the front catalytic converter.
	Crankshaft position sensor	Detects the crankshaft angular position.
	Camshaft position sensor	Detects the combustion cylinder.
	Engine coolant temperature sensor	Detects the engine coolant temperature.
	Knock sensor	Detects engine knocking.
	Vehicle speed sensor	Detects the vehicle speed.
	Ignition switch	Detects operation of the ignition switch.
	Starter switch	Detects the condition of engine cranking.
	Neutral switch (MT)	Detects that the gear is in neutral.
	Inhibitor switch (AT)	Detects shift positions.
	Torque control signal	Controls engine torque.
	Heater circuit of front and rear oxygen sensors	Detects abnormality in the heater circuit of the front and rear oxygen sensors.
	Diagnostics of TCM (AT)	Detects the self-diagnostics of TCM.
	A/C switch	Detects ON-OFF operation of the A/C switch.
	Output signals	Fuel injector
Ignition signal		Turns the primary ignition current ON or OFF.
Fuel pump relay		Turns ON or OFF the fuel pump relay.
A/C control relay		Turns ON or OFF the A/C control relay.
Radiator fan control relay		Turns ON or OFF the radiator fan control relay.
Idle air control solenoid valve		Adjusts the amount of air flowing through the bypass line in the throttle body.
Engine malfunction indicator light		Indicates existence of abnormality.
Purge control solenoid valve		Controls purge of evaporative gas absorbed by the canister.
Pressure control solenoid valve		Controls evaporation pressure in fuel tank.
Drain valve		Closes the evaporation line between the fuel tank and canister to detect leakage of evaporation gases.
Air assist solenoid valve		Adjusts the assist air flow for fuel injection.
Power supply		Controls ON/OFF of the main power supply relay.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

C: FUEL INJECTION CONTROL

- The ECM receives signals from various sensors and based on them, it determines the amount of fuel injected and the fuel injection timing. It performs the sequential fuel injection control over the entire engine operating range except during start-up of the engine.
- The amount of fuel injected depends upon the length of time the injector stays open. The fuel injection duration is determined according to varying operating condition of the engine. For the purpose of achieving highly responsive and accurate fuel injection duration control, the ECM performs a new feedback control that incorporates a learning feature as detailed later.
- The sequential fuel injection control is performed such that fuel is injected accurately at the time when the maximum air intake efficiency can be achieved for each cylinder (i.e., fuel injection is completed just before the intake valve begins to open).

1. FUEL INJECTION DURATION

Fuel injection duration is basically determined as indicated below:

- While cranking the engine:

The duration defined below is used.

- Duration of fuel injection during engine start-up Determined according to the engine coolant temperature detected by the engine coolant temperature sensor.

- During normal operation:

The duration is determined as follows:

Basic duration of fuel injection \times Correction factors + Voltage correction time

- Basic duration of fuel injection The basic length of time fuel is injected. This is determined by two factors — the amount of intake air detected by the manifold absolute pressure sensor and the engine speed monitored by the crankshaft position sensor.
- Correction factors See the next section.
- Voltage correction time This is added to compensate for the time lag before operation of injector that results from variation in the battery voltage.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

2. CORRECTION FACTORS

The following factors are used to correct the basic duration of fuel injection in order to make the air-fuel ratio meet the requirements of varying engine operating conditions:

- **Air-fuel ratio feedback factor:**

This factor is used to correct the basic duration of fuel injection in relation to the actual engine speed. (See the next section for more details.)

- **Start increment factor:**

This factor is used to increase the fuel injection duration only while the engine is being cranked to improve its startability.

- **Coolant-temperature-dependent increment factor:**

This factor is used to increase the fuel injection duration depending on engine coolant temperature signals to facilitate cold starting. The lower the coolant temperature, the greater the increment.

- **After-start increment factor:**

- This factor is used to increase the fuel injection duration for a certain period immediately after start of the engine to stabilize engine operation.
- The increment depends on the coolant temperature at the start of the engine.

- **Wide-open-throttle increment factor:**

This factor is used to increase the fuel injection duration depending on the relationship between the throttle position sensor signal and manifold absolute pressure sensor signal.

- **Acceleration increment factor:**

This factor is used to increase the fuel injection duration to compensate for a time lag between air flow measurement and fuel injection control for better engine response to driver's pedal operation during acceleration.

FUEL INJECTION (FUEL SYSTEM)

3. AIR-FUEL RATIO FEEDBACK FACTOR

The ECM creates this factor utilizing the front oxygen (A/F) sensor signal. When the signal voltage is high, the air-fuel ratio is richer than the stoichiometric ratio. The ECM then makes the fuel injection duration shorter by modifying the factor. When the voltage is low showing that the mixture is lean, the ECM modifies the factor to make the injection duration longer. In this way, the air-fuel ratio is maintained at a level close to the stoichiometric ratio at which the three-way catalytic converter acts most effectively.

| (4) Fuel injector | (D) Low oxygen density |
| (5) Combustion chamber | (E) Lean signal |
| (6) ECM | (F) Rich signal |

4. LEARNING FEATURE

The air-fuel ratio feedback control includes a learning feature which contributes to more accurate and responsive control.

- In the air-fuel ratio feedback control, the ECM calculates the necessary amount of correction based on data from the oxygen sensor and adds the result to the basic duration (which is stored in the ECM's memory for each condition defined by the engine speed and various loads.)
- Without a learning feature, the ECM carries out the above-mentioned process every time. This means that if the amount of necessary correction is large, the air-fuel ratio feedback control becomes less responsive and less accurate.
- The learning feature enables the ECM to store the amount of correction into memory and add it to the basic fuel injection duration to create a new reference fuel injection duration. Using the reference duration as the basic duration for the injection a few times later, the ECM can reduce the amount of correction and thus make its feedback control more accurate and responsive to changes in the air-fuel ratio due to difference in driving condition and sensor/actuator characteristics that may result from unit-to-unit variation or aging over time.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

D: IGNITION CONTROL

- The ECM determines operating condition of the engine based on signals from the manifold absolute pressure sensor, engine coolant temperature sensor, intake air temperature sensor, crankshaft position sensor and other sources. It then selects the ignition timing most appropriate for the condition thus determined from those stored in its memory and outputs at that timing a primary current OFF signal to the igniter to initiate ignition.
- This control uses a quick-to-response learning feature by which the data stored in the ECM memory is processed in comparison with information from various sensors and switches.
- Thus, the ECM can always perform optimum ignition timing taking into account the output, fuel consumption, exhaust gas, and other factors for every engine operating condition.
- Ignition control during start-up Engine speed fluctuates during start of the engine, so the ECM cannot control the ignition timing. During that period, the ignition timing is fixed at 10° BTDC by using the 10° signal from the crankshaft position sensor.

| (4) Ignition timing at starting | (8) Ignition |

FU(H4SO)-34

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

E: IDLE AIR CONTROL

- The ECM activates the idle air control solenoid valve to control the bypass air flowing through the bypass passage in the throttle body depending on signals from the crankshaft position sensor, engine coolant temperature sensor, manifold absolute pressure sensor and A/C switch so that the proper idle speed for each engine load is achieved.
- The idle air control solenoid valve is a stepping motor type valve which moves a shaft up and down to adjust the air flow through the bypass passage according to the signal from the ECM. Thus, the idling speed can always be maintained at the target speed.
- The bypass air control is necessary for:
 - Increasing idling speed when the air conditioning system and/or electrical loads are turned on.
 - Increasing idling speed during early stage of warm up period.
 - Obtaining dashpot function when the throttle valve is quickly closed.
 - Prevention of engine speed variation during idling.

CONTROL SYSTEM

FUEL INJECTION (FUEL SYSTEM)

F: FUEL PUMP CONTROL

Using the signal from the crankshaft position sensor, the ECM controls operation of the fuel pump by turning its relay ON or OFF. To improve safety, the fuel pump is stopped if the engine stalls with the ignition switch ON.

Ignition switch ON	Fuel pump relay	Fuel pump
A certain period of time after ignition switch is turned ON	ON	Operates
While cranking the engine	ON	Operates
While engine is operating	ON	Operates
When engine stops	OFF	Does not operate
