5. Intake Manifold VacuumA: INSPECTION

- 1) Warm-up the engine.
- 2) Disconnect the brake vacuum hose and install the vacuum gauge to the hose fitting on the manifold.
- 3) Keep the engine at the idle speed and read the vacuum gauge indication.

By observing the gauge needle movement, the internal condition of the engine can be diagnosed as described below.

Vacuum pressure (at idling, A/C "OFF"): Less than -60.0 kPa (-450 mmHg, -17.72 inHg)

| Diagnosis of engine condition by measurement of manifold vacuum | |
|---|---|
| Vacuum gauge indication | Possible engine condition |
| Needle is steady but lower than normal position. This ten- | Leakage around intake manifold gasket or disconnection or |
| dency becomes more evident as engine temperature rises. | damaged vacuum hose |
| 2. When engine speed is reduced slowly from higher speed, needle stops temporarily when it is lowering or becomes steady above normal position. | Back pressure too high, or exhaust system clogged |
| 3. Needle intermittently drops to position lower than normal position. | Leakage around cylinder |
| 4. Needle drops suddenly and intermittently from normal position. | Sticky valves |
| 5. When engine speed is gradually increased, needle begins to vibrate rapidly at certain speed, and then vibration increases as engine speed increases. | Weakend stiffness or broken valve springs |
| 6. Needle vibrates above and below normal position in narrow range. | Defective ignition system or idle adjustment |
